Service-policy plane (outside fast motion loop)
Authored service request Scope / approval token
LLM + optional RAG Measured request time
Independent guard Registered service only
Queued service cap Activation after latency
No language authority over motion, geometry, checker, or fallback
Sender forecast / planner Received state and ACKs
plan
Shared byte budget Command + feedback
Delay / loss emulation Absolute timestamps
Receiver command check Otherwise hold
Articulated PSM Physics / task progress
Sampled state, executed milestones, completion, buffered-plan ACKs
Charged feedback traverses independently impaired return transport
